PROFESSIONAL SUMMARY

Aspiring Data Scientist with a foundation in **Python, SQL, statistics, exploratory data analysis, data preprocessing, and supervised machine learning**. Hands-on experience building classification projects involving healthcare and financial datasets, including feature preparation, outlier analysis, scaling, model training, validation, and performance evaluation. Interested in solving practical business problems through data-driven modeling and interpretable machine learning.

TECHNICAL SKILLS

Programming	Python, SQL
Data Analysis	Pandas, NumPy, EDA, Data Cleaning
Statistics	Probability, Descriptive Statistics, Hypothesis Testing, Z-Test, Model Evaluation
Machine Learning	Logistic Regression, Linear Regression, Decision Trees, SVM, Classification, Regression
ML Concepts	Feature Scaling, Cross-Validation, Regularization, Overfitting, Underfitting, Feature Engineering, Outlier Analysis, Class Balance
Tools	Jupyter Notebook, VS Code, GitHub
Currently Exploring	Deep Learning, Advanced Machine Learning

PROJECTS

HeartDiseaseRisk Prediction

Python | Pandas | NumPy | Scikit-learn | Logistic Regression

- Developed a supervised machine learning classification model to predict the **TenYearCHD** target.
- Performed data cleaning, feature-target separation, exploratory analysis, and preprocessing.
- Investigated missing values, feature relationships, and outliers before model development.
- Applied feature standardization before training the Logistic Regression model.
- Achieved **85.25% accuracy** on the evaluated test set.
- Focused on understanding preprocessing decisions and model behavior rather than blindly removing unusual observations.

Loan Status Prediction

Python | Pandas | Scikit-learn | XGBoost | Classification

- Worked with approximately **70,000 records** to predict loan repayment status.
- Analyzed target distribution and identified an approximately balanced **50/50 class distribution**.
- Investigated missing values and potential outliers across age, income, employment experience, loan amount, credit history, and credit score.
- Improved Logistic Regression performance from approximately **86% to 90% accuracy** through model experimentation.
- Explored 5-fold and 10-fold cross-validation, log loss, and model evaluation techniques.
- Experimented with XGBoost and training/test loss to compare model behavior.

Piranha — Risk Scoring Project

Machine Learning | Risk Analytics | Feature Engineering

- Planned a practical risk-scoring project designed around a buy/sell scenario.
- Objective is to transform customer and transaction signals into a measurable risk score.
- Planned workflow includes feature engineering, exploratory analysis, classification modeling, validation, and business-oriented interpretation.

EDUCATION

BachelorofComputer Applications (BCA)

[College / University Name] | Hyderabad, Telangana | Expected Graduation: [Year]

Relevant focus: Python, SQL, Statistics, Data Science, Machine Learning

ADDITIONAL STRENGTHS

• Logical and analytical problem solving • Data-driven decision making • Practical model evaluation • Data quality awareness • Continuous learning in Machine Learning and Data Science

CAREER OBJECTIVE

Seeking an entry-level **Data Scientist / Machine Learning / Data Analyst** opportunity where I can apply Python, SQL, statistics, and machine learning skills to real-world datasets while developing strong industry-level data science expertise.
